To: George H. Balazs <gbalazs@honlab.nmfs.hawaii.edu>, Stacy.Hargrave  
Subject: followup to our meeting this morning

Hello George and Stacy! First off, I just wanted to thank both of you again for meeting with me this afternoon. I am really looking forward to working on this project with both of you!

Regarding a few of the items I was planning on e-mailing you both about:

1) I looked at the data the VR2 acoustic receiver collected from February 12 through March 7, specifically looking at the one which was stationed at the boat mooring line right in the cove area. There were 10 turtles with acoustic tags that were prevalent at the site throughout that time, with 2 others that made brief appearances (either 1 or 4 hits total over the time period), so it seems as though all 12 turtles are present at the site.

2) After looking into the Lotek TDR device closer, and after talking with David, I have learned that the device has primarily been used on sea birds and fish in the past, especially for geo-location studies using light levels to map migration... but there is interest in using these in turtles and other air-breathing animals. (You can check some articles here: <http://www.lotek.com/articles.htm>) The pressure accuracy on the device is +/- 1%, the pressure resolution is 0.05%, the temperature accuracy is "better than 0.2 degrees Celsius" (from the Lotek Tag manual, attached to this e-mail), and the temperature resolution is "0.05 degrees Celsius or better" (also from the Lotek Tag Manual). The accuracy to which both devices records is to the 100th of a decibar for pressure (where 1 decibar = 1 meter depth), and to the 100th of a degree Celsius for temperature.

Also after looking more into the TDR devices, the data which the device gives you are NOT binned - you select the sampling interval (in seconds) for each data recording event, and at that specific time, the logger will record the exact status of each programmed parameter. Therefore, if we set the devices to sample every 15 seconds, every 15 seconds it will record the pressure and temperature in situ, no matter what depth or temperature the turtle is at. These data can then be uploaded into Excel and can be binned at the temporal resolution of our choosing, as long as the binning was in a multiple of the 15 second interval. The device records the date, and time (to the second) with every single data recording event.

The maximum and minimum parameters for temperature, as well as the # of memory bits allocated to that parameter, can be changed. So, if the maximum temperature range were selected to span from 15 degrees to 35 degrees Celsius (which should be more than enough for this study), and the # of bits changed from 12 to 9, each device can record 33 days, 9 hours, and 19 minutes of data (at 15 second intervals). However, by changing the # of bits for the temperature, the resolution of the temperature goes from 0.02 degrees C to 0.039 degrees C. Therefore, as the resolution of the temperature is still below the accuracy, it seems logical to go ahead and set the number of bits for the temperature down to 9.

So, the current plan for the devices is to program the TDRs as I have described above - they will record on the Basic Log (meaning that

they will continuously be recording) every 15 seconds, recording both the in situ depth and temperature for just over 33 days. It will not be operating on the telescoping condition, so once the data storage has been filled up on the device, it will stop recording. This way, the data will not overlap, creating 30 second intervals -which would be too large to get a good idea of turtle behavior- for part of the record.

Let me know if you have any questions before Thursday! Have a great time out on the Big Island tomorrow!

Devon Francke

Subject: History on amputated turtle from Kawainui Canal Fieldwork

4/27/10

Hi Dr. Morris,

Actually quite interesting that we had not seen this turtle since it was released in Oct. 2003. Here is the history on it:

Since it

\_10/11/03\_

Turtle was found with fishing line entangling LFF. Flipper was surgically amputated and turtle was released by Dr. Morris and Shandell at Kawainui, Right of Way on 10/31/03.

SCL = 48.6 cm

WT = 30.7 lbs

\_4/27/10\_

SCL = 53.1 cm

WT = 45.0 lbs
