# Catch Them While You Can

Ephemeral sights

## TRANSIT OF VENUS

**All of the U.S. (and most of the world)** In 1716 the astronomer Edmond Halley, of comet fame, had a brilliant idea: Observations of the transit of Venus, a rare event in which our sister planet crosses between Earth and the sun, could be used to calculate the distance between us and our star. That epic experiment, conducted during the next two transits half a century later, sent dozens of observers to far-flung corners of the world. Their remarkable stories include that

of French astronomer Guillaume le Gentil, who was driven to the brink of insanity after being foiled—twice—in his attempts to witness the event in India.

If you want to try observing the famous transit yourself, clear your calendar for June 5: Your next chance won't come around until 2117. In the continental U.S., anyone with a clear, cloudless view of the horizon should be able to see the black dot of Venus late in the day as it begins to move over the solar disk.

The in-progress transit will

make for a spectacular sunset, but to view the entire event, you'll need to head farther west. The full transit will be visible from just east of Hawaii to just west of Hong Kong. Several travel companies are running educational island trips and cruises in Hawaii and the South Pacific. Our sister Kalmbach publication, *Astronomy*, is offering a tour to see the transit from Hawaii's Big Island.

True transit die-hards may want to follow Louisiana State University astronomer Brad Schaefer's lead and set out for the Australian outback, where the risk of inclement weather is also high. Of course, wherever you are, never stare directly into the sun. Bring viewing equipment, like a sheet of number 14 welder's glass, or project an image with a telescope. [transitofvenus.org](http://transitofvenus.org)

MANILA 4-16-2012  
**Standoff between China and Philippines flares anew**

An initial naval standoff between China and the Philippines at a disputed South China Sea shoal had eased, but tensions flared anew after China deployed a second ship and an aircraft that briefly hovered over the area, Philippine officials said Sunday.

The South China Sea has become more vulnerable to confrontations after governments with conflicting territorial claims started beefing up their maritime forces. A Philippine warship attempted to arrest several Chinese fishermen, who were accused of illegally entering and collecting endangered coral, giant clams and live sharks Tuesday at the disputed Scarborough Shoal off the northwestern Philippines.

Carlyle Thayer, a South China Sea specialist at the University of New South Wales in Australia, said the Scarborough standoff was the latest reminder of an urgent need for China and other claimant countries to come up with arrangements to ensure that disagreements, like fishermen straying into disputed waters, would not become violent, while the territorial disputes remain unresolved. "If the South China Sea can be compared to a bathtub, it is only a matter of time before there is a collision in this congested space," he said.

AN INTERVIEW OF MR. GRANT DOOLEY, APRIL 2012  
CONSUL GENERAL OF AUSTRALIA IN GUANGZHOU

广州是个“勇猛少年” IN flight CHINA Southern NO. 154 NI HAO  
——澳大利亚驻广州总领事杜恪然

**FOR WESTERNERS INTENDING TO WORK OR INVEST IN CHINA, ASIDE FROM LANGUAGE, WHAT OTHER SKILLS, CHARACTER TRAITS OR KNOWLEDGE ARE USEFUL?**

That is easy, patience. I am a patient man myself and it really does help here. For anyone wanting to work or invest in China, you need to be happy to play the long game. The best advice I can give is to say doing business here is not a sprint, it is a marathon. You have to do the basics, starting with establishing relationships. It is not just about investing money, you have to invest time. If you can do that there is a good chance you can be a success. You also need to have a realistic attitude in terms of what you can achieve in a certain time.

对于未来想到中国工作或投资的西方人而言，除了语言，还需要掌握哪些知识或技能？  
很简单，耐心。我是个很有耐心的人，这对我在中国生活大有益处。对于想到中国工作或投资的人，你要做好打持久战的准备。我能给的最好建议就是，在这里做生意不是百米冲刺，而是马拉松。你必须从基本做起，从建立关系开始。这意味着不光要投资金钱，还要付出时间。如果你能做到这一点，你很有可能成功。当然，你还需要有一个现实的态度，知道自己想要的是什么。

“PATIENCE”

*BUSINESS CARDS - SO VERY IMPORTANT + include SOME NATIVE LANGUAGE*

# Scarborough Shoal

From Wikipedia, the free encyclopedia

**Scarborough Shoal** or **Scarborough Reef**<sup>[1]</sup> (Chinese name: Huangyan Island; simplified Chinese: 黄岩岛; traditional Chinese: 黃岩島; pinyin: *Huángyán Dǎo*; Philippine name: Panatag Shoal, Bajo de Masinloc), more correctly described as a group of islands and reefs in an atoll shape than a shoal, is located between the Macclesfield Bank (Zhongsha Islands) and Luzon Island of Philippines in the South China Sea. To the east, the 5,000 - 6,000 meter deep Manila Trench separates the shoal from Philippine Archipelago. As with most of the landforms in this sea, the sovereignty of the area is disputed. After the Chinese Civil War, the People's Republic of China and the Republic of China (Taiwan) both lay claim to the shoal. Starting in 1997, Philippines<sup>[2]</sup> joined in this dispute, making its claim to the shoal.

The shoal was named after a tea-trade ship *Scarborough* which was wrecked on the rock with everyone perishing on board in the late 18th century.<sup>[3]</sup>

## Geography

The shoal forms a triangle-shaped chain of reefs and islands (but mostly rocks) 55 kilometres (34 mi) around with an area of about 150 square kilometers. It has a lagoon with area of 130 km<sup>2</sup> and depth of about 15 metres (49 ft). The shoal is a protrusion from a 3,500 m deep abyssal plain. Several of the islands including "South Rock"

are 1/2 m to 3 m high and many of the islands in the lagoon are the ruins of an iron mine. The nearest landmass is Palauig, Zamboanga.

Abstract of Presentation by George Balazs April 10, 2012 Shanghai, PR China

Title: Partnership research of marine turtles at the NOAA Pacific Islands Fisheries Science Center: Identifying loggerhead pelagic foraging ecology

Since 1997, the Ecosystems and Oceanography Division and the Marine Turtle Research Program of the NOAA Pacific Islands Fisheries Science Center in Honolulu, Hawaii have effectively worked together with an array of national and international Pacific partners to study the endangered loggerhead turtle, *Caretta caretta*. Loggerheads in the North Pacific range from East Asia to North America and consist of one genetic stock with nesting exclusively in Japan.

Our research of this far-ranging highly migratory species focuses on movements and foraging patterns that significantly involve both high-seas and coastal habitats. A major objective of this work is to understand the underlying oceanographic dynamic features associated with loggerhead movements, hence foraging ecology. The results of this partnership are experimentally used to reduce loggerhead interactions with longline and other fisheries, thereby aiding in the conservation of the species. Our research tools include small Argos-linked transmitter tags and satellite remotely sensed oceanographic data, specific for the weekly movement locations of the turtles.

Many of the loggerheads used in our studies have been reared from hatchlings for 2-4 years at the Port of Nagoya Public Aquarium in Japan. Argos-linked tags are attached to the carapace and the turtles are released offshore in appropriate habitats. Other loggerheads in our studies have been tagged and released after incidental capture in poundnet and longline fisheries. To date, we have successfully tracked and investigated the movements of 450 loggerheads. The profiling of diving patterns has also been studied. Releasing loggerheads for research in this manner has resulted in 11 prominent journal publications. Additional papers are currently in preparation.

Four of the publications featured in this powerpoint presentation are listed below. Of particular interest to the China Region EEZ is the discovery of three distinct ocean "hotspots" for loggerheads located off Shantou (Guangdong Province), Changle (Fujian Province), and Ningbo (Zhejiang Province), People's Republic of China (see Kobayashi et al. 2011 below).

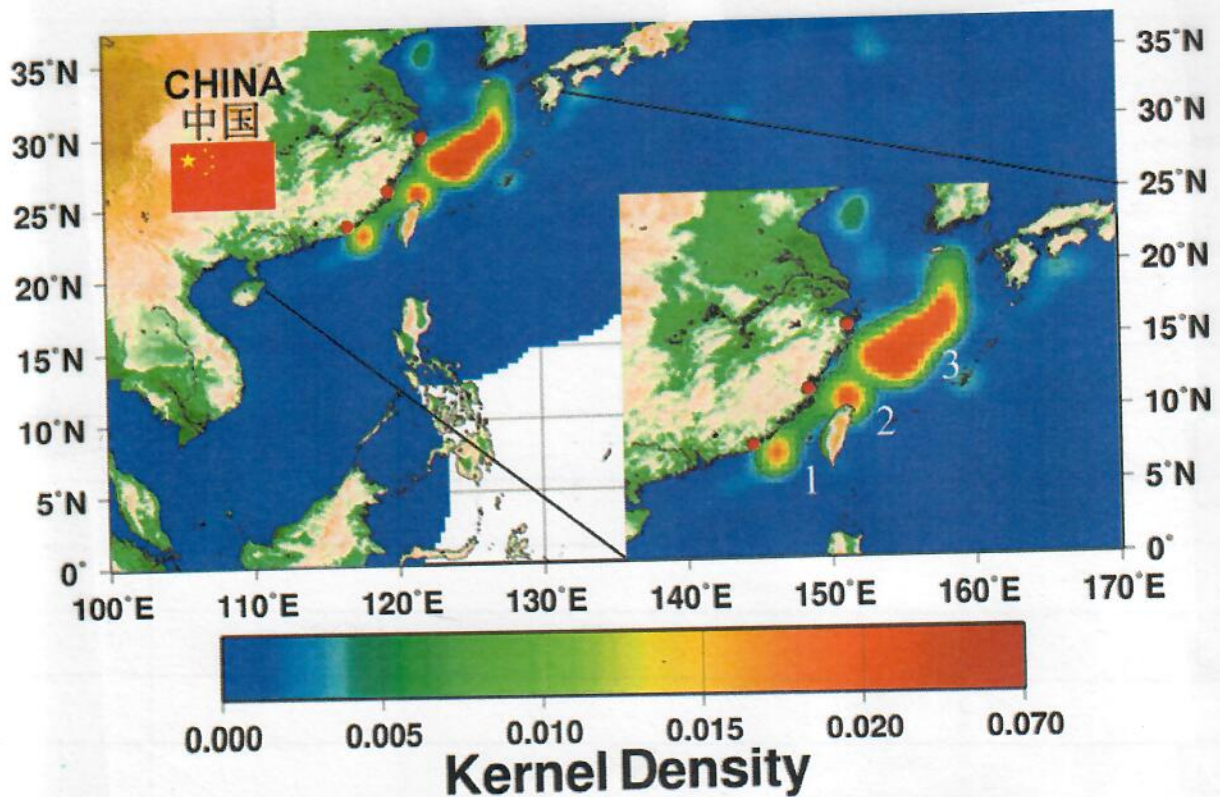

Having new colleagues from China in this international research partnership, facilitated by the Chinese Academy of Fishery Sciences, would greatly expand and strengthen China/USA bilateral capacity and cooperation to learn more about loggerheads in an important region of the species range. We sincerely welcome and encourage China's involvement in this international science effort.

Howell, Kobayashi, Parker, Balazs and Polovina. 2008. TurtleWatch: A tool to aid in the bycatch reduction of loggerhead turtles in the Hawaii-based pelagic longline fishery. *Endangered Species Research*, 5: 267-278.

Howell, Dutton, Polovina, Bailey, Parker and Balazs. 2010. Oceanographic influences on the dive behavior of juvenile loggerhead turtles in the North Pacific Ocean. *Marine Biology* 157:1011-1026.

# 1997-2012 Satellite tracking

# Belagic North Pacific loggerheads

Abstract of Presentation 1 by George Balazs April 10, 2012 Shanghai, PR China

Title: Partnership research of marine turtles at the NOAA Pacific Islands Fisheries Science Center: Hawaii, East Asia, and the North Pacific.

The NOAA Pacific Islands Fisheries Science Center (PIFSC) in Hawaii conducts an array of marine turtle studies involving several programs and disciplines that include stock assessment, biology and life history, bycatch analysis and mitigation, physiology, and pelagic ecology. Both national and international collaborative research by the PIFSC occurs across a broad region of the Pacific, from the Americas to East and Southeast Asia. Hawaii is well-situated for such partnership roles due to its mid-Pacific location 4000 km from the USA Mainland, and a multi-cultural heritage linked closely to China, Japan, Korea, and the Philippines. A strong teamwork approach is promoted for all research partners by building upon mutual respect, trust, and the free flow of information. NOAA scientists at the PIFSC and the Southwest Fisheries Science Center (in California) have a close and coordinated relationship exemplified in the fields of turtle genetics, migration patterns, and foraging ecology.

Research of marine turtles at the PIFSC traces its origin to 1972 when the Hawaii Institute of Marine Biology (State of Hawaii) initiated a captive rearing study of green turtles (*Chelonia mydas*) and started a systematic monitoring and tagging program of seasonal nesting at East Island in the remote Northwestern Hawaiian Islands. Flipper tags were significantly improved upon during this early era. The ocean capture and tagging of immature turtles in Hawaii's common foraging areas began in the late 1970's. In 1982, a turtle stranding and necropsy program was started to examine health, disease, and causes of mortality. In 1992, satellite tracking was initiated of nesters and later expanded to immature turtles as transmitter tags became smaller. Forty years of continuous turtle research in Hawaii has resulted in numerous comprehensive computerized data sets useful for management and available for cooperative study. Forty years of conservation efforts in Hawaii have resulted in an increasing green turtle population well on its way to biological recovery. And last but not least, 40 years of research and conservation experiences in Hawaii offer superb opportunities for academic exchange to strengthen and expand China/USA bilateral science capacity and cooperation, facilitated by NOAA and the Chinese Academy of Fishery Sciences.

Dear Patrick,

I am the graduate of ENS 2006 and have transferred HKD 5,000 to the CUHK bank account provided in the preceding message. Please kindly advise how you would pass the donation to Ms. Leuna Tsz Yan.

**US-China Sea Turtle Workshop**  
**April 10, 2012**  
**Potential Collaborative Research**

Species of interest: Green turtle, Loggerhead, Leatherback

**Priority Research Projects**

1. Biology and Ecology:
  - a. Develop proposal on a specific area/region to assess foraging ecology (PIFSC, SWFSC, SCSFRI)
2. Distribution:
  - a. Analyze tagging data mapped to oceanographic parameters (2-3 dimensional) (PIFSC, SWFSC, SCSFRI)

**Other Potential Research Projects**

3. Assess stock structure (genetics & tagging)
4. Identify critical habitat (risks to turtles in the open ocean & meta-population analysis)
5. Impacts from environmental contaminants
6. Ecosystem approaches to management
7. Stock enhancement techniques
8. Climate Change: Impacts on spawning /feeding migrations and nesting beaches
9. Bycatch Mitigation: Gear modifications, decision tools (Turtle Watch), safe practices (training-outreach: conducted at the Guangdong Turtle Reserve)
10. Enhancing Baseline Data Collection (a natural outcome of collaboration)
11. Management: Strategies for managing natural reserves (e.g., monitoring, research, outreach, development of evaluation metrics...) and use of visualization tools for decision making

**Mechanisms for Collaboration**

- Establishment of a joint Sea Turtle Working Group (U.S. Leads: Jeffrey Seminoff (SWFSC) and George Balazs (PIFSC); Chinese Leads: Huang Honghui (SCFRI), and Zhang Feiyan (Gangkou Sea Turtle Reserve)
- Data sharing and analyses, including scientist exchanges (recommended method to achieve the foraging ecology and distribution research)
- Regular meetings to discuss activities and successes

## US-China Sea Turtle Workshop

#### Mechanisms for Collaboration

- Establishment of a joint Sea Turtle Working Group (U.S. Leads: Jeffrey Seminoff (SWFSC) and George Balazs (PIFSC); Chinese Leads: Huang Honghui (SCFRI), and Zhang Feiyan (Gangkou Sea Turtle Reserve)
- Data sharing and analyses, including scientist exchanges (recommended method to achieve the foraging ecology and distribution research)
- Regular meetings to discuss activities and successes

photo.

Gave power point  
presentation - I took  
photos.

Observed loggerhead in pool -  
David fed it fish & crabs (dead). Active but LFF not fully  
working at times. Dives fine.  
Hard feces PASSED with fish bones inside.
